## Progressing at Hillcrest.

A more exhaustive survey of what is going on at Hillcrest country club last evening revealed remarkable progress by Perry Maxwell, Ardmore golf club architect, and "Ducky" Marshall, local contractor. Teams and power machinery still are moving dirt from inconvenient humps, to build new greens and tees. All greens had been roughed up to grade by last evening, with the exception of the new No. 1 and No. 2 with adjacent tees also shaped up.

All that remains to put these greens and tees in shape is the final layers of rich soil and fertilizer, hand raking, seeding and sprinkling. Each of these tees and greens has been located and constructed so as to blend harmoniously with the natural contour of

## Has New Tricks

the land; the finished job should look very much like a job by old Mother Nature, herself.

Since the greens and tees are to be of the grass type, each of them must be supplied with water. For this purpose a three-inch line is being strung from the city filter house on the hill to the course, to provide raw water from the Verdigris river at a cost below that for treated water, such as is found in the city mains. A crew started bucking the line in yesterday morning and by early afternoon had completed the three-inch section from the filter house to the No. 3 green.

From this point the line will be of 2-inch pipe, branching out to every tee and green on the course. The entire system will be buried at least a foot deep and will be fitted with cocks at every T-connection and with drain cocks at every low point. Possible trouble in the system thus may be repaired without interfering with its operation, while freezing also can be eliminated in cool weather. The system will contain about 5,400 feet of pipe when completed. All ditches for the pipe have been completed and the task of bucking the line together, painting it with asphalt base paint and burying it should move along speedily, now that it has been well started.

Having been on the job but two weeks, the men feel they have made remarkable progress, aided by favorable weather. Their work also has been with a view to the future. Sod which has been stripped away from borrow pits has been piled up to form compost heaps, from which fertilizer may be gained for future improvement of the greens and fairways. Timber grubbed from the new fairways is being sawed, split and ricked near the clubhouse, for use in the club's fireplaces this winter.

From the high point in the northern part of the course, every green and tee can be seen. It probably is the only course in the country, the workmen say, from which a gallery may watch an entire match with a pair of field glasses, without having to take a step. And the view, plenty interesting now, will be much finer when the entire course is given the "park effect" beauty treatment which is planned.

The new line of play starts just north of the clubhouse, east by north to the northeast corner of the Hillcrest tract, straight south for a medium length dogleg No. 2; back northwest for a short No. 3; south for a dogleg No. 4; westward along the road to No. 5; back eastward for a short No. 6; north by west toward the clubhouse for a fairly long No. 7; southwest again for a long No. 8; north by east for the long No. 9, to the final green lying just at the foot of clubhouse hill. The exact yardages probably will be determined in the near future.
